The invention relates to a short interfering nucleic acid (sinh) molecule that down-regulates expression of a hepatitis B virus (HBV) gene by RNA interference or that inhibite HBV replication. Also disclosed are the following: (i) a method of modulating the expression of a HBV gene in a following: (i) a method of generating a library of sinh constructs tissue explant; (ii)) a method of generating a library of sinh constructs complexity; (iii) a cell containing one or more sinh molecules; (iv) a kit containing a sinh molecule which can be used to modulate the expression of a HBV target gene in a cell, tissue or computate the expression of a HBV target gene in a cell, tissue or molecule is adapted for use to treat HBV infection, and comprises sequence complementary to an RNA sequence encoding HBV and the sense region comprises sequence complementary to the antisense region comprises the sense region and the sense region of the sinh molecule is assembled from 2 nuclecule, where sense region mad the confisense region of the sinh molecule. Where sense region and the sense region and the sense region of the sinh molecule. The linker molecule is a polynucleotide inker molecule. The linker molecule is a polynucleotide confisense region of the antisense region of the sinh all the sense region comprises a 3 - terminal overhang and the antisense region comprises a 3 - terminal coverhang and the antisense region comprises a 3 - terminal coverhang and the antisense region comprises a 3 - terminal coverhang and the antisense region comprises a conformentary to RNA cencoding HBV. The siNA is useful for treating human hepatitis B virus infections, and for characterising pathways of gene function, e.g. to inhibit activity of target genes in a pathway to determine the function conformation between in genes function analysis. The sinh molecules in spender represents 1 of 1504 HBV with a sunfor research settings.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Virucide; Hepatotropic; Gene therapy; ss; short interfering nucleic acid; siNA; hepatitis B virus; HBV; RNA interference.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

```
The invention relates to a short interfering nucleic acid (siNA) molecule that down-regulates expression of a hepatitis B virus (HBV) gene by RNA interference or that inhibits HBV replication. Also disclosed are the collowing: (i) a method of modulating the expression of a HBV gene in a tissue explant; (ii)) a method of generating a library of siNA constructs molecules; (iv)a kit containing a siNA molecule which can be used to modulate the expression of a HBV target gene in a cell, tissue or modulate the expression of a HBV target gene in a cell, tissue or conjulate the expression of a HBV target gene in a cell, tissue or molecule is adapted for use to treat HBV infection, and comprises a sense of molecule is adapted for use to treat HBV infection, and comprises sequence complementary to an RNA sequence encoding HBV and the sense region comprises sequence complementary to the antisense region. Where the silva comprises the sense region and the second fragment comprises the comprises the sense region and the second fragment comprises the antisense region of the silva molecule. Where sense region and the cantisense region of the silva molecule is a polynucleotide. Comprises separate oligonucleotides, and are covalently connected via a linker molecule. The linker molecule is a polynucleotide. The sense region comprises a 3'-terminal overhang and the antisense region 3'-terminal overhang is complementary to RNA encoding HBV. The silva is useful for treating human hepatitis B virus concing HBV. The silva is useful for treating human hepatitis B virus concing hBV. The silva is useful for treating human hepatitis B virus confidence of unkibit activity of target genes in a pathway to determine the function of unkibit activity of target genes in a pathway to determine the function may also he used in clinical, industrial, enhancemental, and per function may also he used in clinical, industrial, he with may also he used in a plant function may also he used in clinical industrial industrial industrial industrial industria
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             may also be used in clinical, industrial, environmental, agricultural and/or research settings. The present sequence represents 1 of 1504 HBV
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 siNA molecules of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Human HER2 (EGFR2) transcript target sequence/siNA upper strand, SEQ:180.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to short interfering nucleic acids (siNA) which downregulate expression of one or more human epidermal growth factor receptor (EGFR) genes (including HER1, HER2 HER3 and HER4) by RNA interference. The siNas may or may not comprise ribonuclectides and may be double or single stranded. They further comprise sense and antisense
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New short interfering nucleic acid, useful e.g. for treatment and diagnosis of cancer, downregulates expression of the epidermal growth factor receptor gene.
                     studying gene function, and gene mapping (e.g., of single nucleotide polymorphisms). The present sequence represents the upper strand of a human HER2 (EGFR2)-targeted double-stranded siNA, which is identical

an antisense oligonucleotide. Specifically, the sinks include short interfering RNA (siRNA), double stranded RNA, micro-RNA (miRNA) and short hairpin RNA (shRNA). The sinks can be unmodified or chemically modified, can contain deoxyribonucleotides, and can be chemically synthesised, capressed from a vector or enzymatically synthesised. The invention also relates to kits for the in vitro or in vivo delivery of sink, conjugates and/or complexes of sink, and vectors that express sink. Conjugates used to modulate expression of EGFR genes in cells, tissue explants or organisms (e.g., by ex vivo gene therapy), or in grafts and transplants for the treatment of a variety of conditions. They may be used for treating a wide range of cancers such as breast and ovarian cancer. The sinks are also useful for drug screening, diagnosis, therapeutic target identification and validation, genetic engineering, pharmacogenomics, studying gene function, and gene mapping (e.g., of single nucleotide pluman HER2 (EGFR2)-targeted double-stranded sink, which is identical to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
or alternatively are assembled from a sense oligonucleotide and

dwortegulate expression of one or more human epidermal growth factor receptor (BGFR) genes (including HER1, HER2 HER3 and HER4) by RNA interference. The siNAs may or may not comprise ribonuclectides and may be double or single stranded. They further comprise sense and mantisense regions, or alternatively are assembled from a sense oligonuclectide and mitsense oligonuclectide. Specifically, the siNAs include short interfering RNA (siRNA), double-stranded RNA, micro-RNA (miRNA) and short hairpin RNA (siRNA). The siNAs can be unmodified or chemically modified, expressed from a vector or enzymatically synthesised. The invention also relates to kits for the in vitro or in vivo delivery of siNA; conjugates and confund modified expression of EGFR genes in cells, tissue explants or organisms (e.g., by ex vivo gene therapy), or in grafts and transplants for the treatment of a variety of conditions. They may be used for treatment of a variety of conditions. They may be used for treatment of a variety of conditions. They may be used for treatment of a variety of conditions. They may be used for treatment of a variety of conditions. They may be used for treatment of a variety of conditions. They may be used for treatment of a variety of conditions. They may be used for treatment of a variety of conditions, therapeutic target identification and validation, genetic engineering, pharmacogenomics, studying gene function, and gene mapping (e.g., of single nucleotide polymorphisms). The present sequence represents the lower strand of a HERZ (EGFRZ)-targeted double-stranded sinA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                          New short interfering nucleic acid, useful e.g. for treatment and diagnosis of cancer, downregulates expression of the epidermal growth
                                                                                                                                                                              The invention relates to short interfering nucleic acids (siNA) which

The invention relates to short interfering nucleic acids (siNA) which downregulate expression of one or more human epidermal growth factor receptor (ESPR) genes (including HER1, HER2 and HER4) by RNA interference. The siNAs may or may not comprise ribonucleotides and may be double or single stranded. They further comprise sense and antisense regions, or alternatively are assembled from a sense oligonucleotide and an antisense oligonucleotide. Specifically, the siNAs include short interfering RNA (siRNA), double-stranded RNA, micro-RNA (miRNA) and short interfering RNA (siRNA). The siNAs can be unmodified or chemically modified, can contain deoxyribonucleotides, and can be chemically synthesised, expressed from a vector or enzymatically synthesised. The invention also relates to kits for the in vitro or in vivo delivery of siNA; conjugates and vector or enzymatically synthesised. The siNAs are used to modulate expression of EGFR genes in cells, tissue explants or organisms (e.g., by ex vivo gene therapy), or in grafts and transplants corganisms (e.g., by ex vivo gene therapy), or in grafts and transplants the treating a wide range of cancers such as breast and ovarian cancer. The siNAs are also useful for drug screening, diagnosis, therapeutic target studying gene function, and gene mapping (e.g., of single nucleotide polymorphisms). The present sequence represents the lower strand of a betage of the mapping (e.g., of single nucleotide polymorphisms). The present sequence represents the lower strand of a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     cytostatic; vasotropic; nephrotropic; cerebroprotective; treating leukaemia; solid tumors; restenosis; polycystic kidney disease; bronchiolitis; glomerulonephritis; stroke; RNA interference; short interfering nucleic acid; siNA; short interfering RNA; siRNA; double-stranded RNA; micro-RNA; miRNA; short harripin RNA; shRNA; expression modulation; gene therapy; drug screening; diagnosis; therapeutic target identification; pharmacogenomics;

WO2003072704-A2 Homo sapiens. 20-FEB-2002; 11-MAR-2002; 36-JUN-2002; 04-SEP-2003. The invention relates to short interfering nucleic acids (siNA) which downregulate expression of the human platelet-derived growth factor ceceptor (PDGFT) gene by RNA interference. The siNAs may or may not comprise ribonuclectides and may be double or single stranded. They turther comprise sense and may be double or single stranded. They curther comprise sense oligonuclectide and an antisense oligonuclectide. Specifically, the siNAs include short interfering RNA (siRNA, doublestranded RNA, micro-RNA (miRNA) and short hairpin RNA (siRNA, doublestranded RNA, micro-RNA (miRNA) and short hairpin RNA (siRNA). The siNAs can be unmodified or chemically modified, can contain also relates to kits complexes and can be chemically synthesised, expressed from a vector or enzymatically synthesised. The invention also relates to kits for the in vitro or in vivo delivery of siRNA; conjugates and/or complexes of siRNA; and vectors that express siNA. The siNAs are used to modulate expression of the PDGFr gene in cells, tissue explants or organisms (e.g., by ex vivo gene therapy), or in grafts and transplants for the treatment of a variety of conditions. They may be used for treating leukaemia and solid tumours, restenosis, polycystic kidney clasease, bronchiolitis, glomerulonebritis and stroke. The siNAs are also useful for drug screening, diagnosis, therapeutic target identification condition, and gene mapping (e.g., of single nucleotide polymorphisms). The present sequence represents the upper strand of a human PDGFr transcript targeted doubble-stranded siNA, which is identical to the PDGFr transcript New short interfering nucleic acid, useful e.g. for treatment and diagnosis of tumors, downregulates expression of the platelet-derived growth factor receptor gene. to Pharmaceutical composition for treating asthma, has antisense oligonucleotide containing less percentage of adenosine, targeted trucleic acids associated with lung airway or lung dysfunction, and bronchodilating agent

Claim 15; SEQ ID NO 3836; 763pp; English.

This invention describes a novel composition (a) a first active agent, comprising oligonuclectides, effective for alleviating branchoconstriction, respiratory tract inflammation, allergies and reducing adenosine ensitivity, levels of adenosine (A) or (A) receptors, surfactant depletion or hyposecretion, when administered to a mammal. The oligonuclectides are derived from a gene encoding or regulating expression of a target polypeptide associated with lung airway or lung dysfunction or cancer and can be anti-sense to the corresponding mRNA. The invention also describes a kit, that comprises: (a) a delivery device, in separate containers, (b) the oligonucleotides, (c) instructions for adding a carrier and for use of the kit. The composition of the invention has antiallergic, antiinflammatory, antiasthmatic. with a disease or condition such as pulmonary vasoconstriction, inflammation, allergies, asthma, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, allergic rhinitis, pulmonary hypertension, emphysema, chronic obstructive pulmonary disease, pulmonary transplantation rejection, pulmonary infections, bronchitis or cancer. The reduced adenosine content of the anti-sense oligos corresponding to thymidines present in the target RNA serves to prevent the breakdown of analgesic, hypotensive, immunosuppressive and cytostatic activity, is a beta-adrenergic agonist. The composition is useful for preventing or treating a respiratory, lung or malignant disease. The administered composition comprises oligo and is administered to reduce the production or availability, or to increase the degradation of the target mRNA or to pulmonary obstruction, and/or bronchoconstriction and/or lungs inflammation, allergies and/or surfactant hypoproduction are associated

.. 0 The invention relates to a method of detecting the base sequence for RNA interference by detecting the regions in the DNA sequence fulfilling the following requirements such as: (i) the base at 3' terminal is adenine, thymine or uracil; (ii) the base at 5' terminal is guanine or cyclosine; (iii) the seven base sequence at 3' terminal is guanine or cyclosine; and uracil, and; (iv) there are bases in a such a number that it causes RNA interference without showing cyclotoxicity. The method is used for designing and synthesizing siRNA causing RNA interference. This sequence corresponds to an RNA interference target sequence of the invention. This invention relates to a novel method of introducing a nucleic acid into an adipocyte which comprises contacting an adipocyte having a cell membrane with a nucleic acid molecule, thus forming a mixture and electroporating the mixture under conditions such that the cell membrane becomes permeabilised, such that the nucleic acid is introduced into the adpocyte. The invention may be useful for the production of compounds with an antidiabetic or anorectic activity whilst the disclosed sequences may be useful for gene therapy. The methods are useful for treating type if diabetes, insulin resistance or obesity. The present sequence is that of a region of a gene which may be targeted by short inhibitory RNA (SIRNA) used with the method of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a method of detecting the base sequence for RNA interference by detecting the regions in the DNA sequence fulfilling the following requirements such as: (i) the base at 3 'terminal is adenine, thymine or uracil; (ii) the base at 5' terminal is guanine or cytosine; (iii) the seven base sequence at 3' terminal is graine or cytosine; (iii) the seven base sequence at 3' terminal is rich in adenine, thymine and uracil, and; (iv) there are bases in a such a number that it causes RNA interference without showing cytotoxicity. The method is used for designing and synthesizing siRNA causing RNA interference. This sequence corresponds to an RNA interference target sequence of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Detecting sequence of RNA interference useful for synthesizing siRNA, by detecting regions in sequence fulfilling specific criteria such as base at 3' terminal is adenine, thymine or uracil, base at 5' terminal is

The sequences given in AAQ93370-441 represent oligomers which are capable of hybridising to an invariant proximal or distal sequence of a single mucleotide polymorphism (SNP) site in equine DNA. These oligomers act as primers, where template-dependent extension of the primer by a single nucleotide base can be used to identify the polymorphic allele. These sequences may be used to in the analysis of 18 SNP's from 5 different horses. The analysis of SNP's is useful in determining identity, ancestry or prediposition to genetic diseases. The method may also be used to determine the linkage between two genetic traits
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Invariant; proximal; distal; single nucleotide polymorphism; SNP; equine; human; primer; template-dependent extension; identification; polymorphic allele; horse; identity; genotype; ancestry; parentage; prediposition; genetic disease; linkage; ss.
                                         PCR amplification was conducted to determine tissue expression of defensin genes. For amplification of defensin 5 related sequences an upstream sense primer was chosen from one defensin-related open reading frame (HNP63S) and the downstream antisense primer was chosen from the other (HS1261a). These primers were chosen so the amplification product would include an intron when the template was genomic DNA, a possible contaminant in a pool of cDNA. Control amplifications from the cDNA templates used primer pairs (HTUBs and HTUBa) from the alpha-tubulin sequence. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Nucleic acid mols, for identifying single nucleotide polymorphism sites and related methods, useful for genotyping human or horse genome(s) for analysis of pre-disposition to genetic traits, etc.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Equine clone 595-1 5' proximal antisense strand SNP detection oligo.

                                                                                                                                                                                                                                                          This 20-mer oligonuclectide primer is used in a novel method of amplifying a nucleic acid molecule involving ribonuclectide tailing of single stranded DNA in the persence of terminal transferase. This method can be used for sequencing RNA, especially the 5'-end and involves a 3' tail of 2 to 4 ribonuclectides being attached onto the target sequence with high efficiency. The first step in cloning and sequencing the unknown 5'-end of a specific mRNA molecule involves the synthesis of single stranded cDNA using a primer specific for a known region in the 3' region of the mRNA, A tail of two rGTP's is attached to the mRNA using terminal transferase and a specific double stranded DNA adapter is attached via a complementary 3' overhang (i.e. CC) in the presence of T4 DNA ligase. PCR amplification using a 5'-bictinylated adapter specific primer and a cDNA-specific nested primer including a desired restriction site produces a unique PCR product suitable for direct solid-phase sequencing or dideoxy sequencing after a cloning step using restriction

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The sequences given in AAQ93370-441 represent oligomers which are capable of hybridising to an invariant proximal or distal sequence of a single mucleotide polymorphism (SNP) site in equine DN. These oligomers act as primers, where template-dependent extension of the primer by a single nucleotide base can be used to identify the polymorphic allele. These sequences may be used to in the analysis of 18 SNP's from 5 different horses. The analysis of SNP's is useful in determining identity, ancestry or prediposition to genetic diseases. The method may also be used to determine the linkage between two genetic traits
                                                                                                                                                                                                                   Invariant; proximal; distal; single nucleotide polymorphism; SNP; equine; human; primer; template-dependent extension; identification; polymorphic allele; horse; identity; genotype; ancestry; parentage; prediposition; genetic disease; linkage; ss.

These oligomers act as primers, where template-dependent extension of the primer by a single nucleotide base can be used to identify the polymorphic allele. These sequences may be used to in the analysis of 18 SNP's from 5 different horses. The analysis of SNP's is useful in determining identity, ancestry or prediposition to genetic diseases. The method may also be used to determine the linkage between two genetic traits
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Invariant; proximal; distal; single nucleotide polymorphism; SNP; equine; human; primer; template-dependent extension; identification; polymorphic allele; horse; identity; genotype; ancestry; parentage; prediposition; genetic disease; linkage; ss.

Detecting polymorphisms between 2 nucleic acid samples, esp. in microsatellite regions, comprises digesting the nucleic acid to generate fragments, ligating adaptor segments to their ends, amplifying them using primer directed amplification and comparing the prods. to detect differences. The primers used in the amplification comprise a primer consisting of a perfect cpd. simple sequence repeat (SSR), and an adaptor segment. The present sequence is an example of a compound SSR primer rethod represents a modified annulative of a compound SSR primer assay, which is partic. useful for genome fingerprinting, i.e. for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Detecting polymorphisms between 2 nucleic acid samples, esp. in microsatellite regions, comprises digesting the nucleic acid to generate fragments, ligating adaptor segments to their ends, amplifying them using primer directed amplification and comparing the prods. to detect differences. The primers used in the amplification comprise a primer directed primer, comprising a sequence repeat (SSN), and an adaptor segment. The present sequence is an example of a compound SSR primer.                                                                                                                                                                                                                                                                                                                                                                                                                            The sequences given in AAQ93370-441 represent oligomers which are capable of hybridising to an invariant proximal or distal sequence of a single nucleotide polymorphism (SNP) site in equine DNA. These oligomers act as primers, where template-dependent extension of the primer by a single nucleotide base can be used to identify the polymorphic allele. These sequences may be used to in the analysis of 18 SNP's from 5 different horses. The analysis of SNP's is useful in determining identity, ancestry or prediposition to genetic diseases. The method may also be used to determine the linkage between two genetic traits
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Modified amplified fragment length polymorphism assay - for detection of polymorphism esp. in micro:satellite regions.
                                                                                                                                                                                                                                                                                           Nucleic acid mols. for identifying single nucleotide polymorphism sites and related methods, useful for genotyping human or horse genome(s) for analysis of pre-disposition to genetic traits, etc.

The oligonucleotides (ONS) are targeted to either coding region, start or stop signal or 5' or 3' untranslated region (UTR) mNNA encoding human c-raf. The ONS may be phosphorothioate linked and may contain modifications at the 2' position of the sugar molety. ONs are pref. complementary to either 3' or 5' UTRs, phosphorothioate linked and contain 2'-O-alkyl sugar modifications. The ONS are used to inhibit expression of human raf in partic. in conditions associated with hyperproliferation e.g. cancer, restenosis, and psoriasis

This sequence is an example of an oligonuclectide of the invention, and is an inhibitor of c-raf expression. The invention relates to conjugance (A), which specifically hybridises to RNA or DNA, comprises a linear sequence of nuclectide units linked by phosphodiseter or phosphorochicate linkages, comprising a first subsequence having 2'-O-CC CH2-CH2-O-CH3 sugar moieties and a second subsequence having 2'-O-CC CH2-CH2-O-CH3 sugar moieties and a second subsequence having 2'-O-CC CM2-CH2-O-CH3 sugar moieties and as RNAseM activity for cleaving a complementary strand, can be used to modulate the expression of ras, rafe and protein kinase C genes, useful in the therapy of AIDS, atherosclerosis, bacterial or other infections, or to control aberrant cell growth in humans, animals or plants. (A) can also be used diagnostically, particularly when labelled, to detect overexpression of chagnostically, particularly when including imaging of tissue sections, and as a research reagent. (A) has increased binding affinity for complementary strands (attributable to the 2'-O-CH2-CH3-O-CH3 sugar moiety, which overcomes the loss of affinity caused by altered intersugar collinks), and increased resistance to nuclease (from the modified links and

AMTS9716-28 are preferred oligonucleotides which are targeted to mRNA concoding human raf and are capable of inhibiting raf expression. Compositions containing the oligonucleotides entrapped in sterically stabilised liposomes are claimed. The compsns. can be used for inhibiting the expression of human raf. They can be used for the treatment of mammalian cancer, partic. human cancer e.g. lung, stomach, renal, breast, laryngeal, pancreatic, colorectal cancer and malignant melanoma. In particular the compsns. can inhibit abnormal raf expression and retain anti-hyperproliferative activity after prolonged circulation in the bloodstream. They facilitate the reduction of accumulation of ONs in nontarget organs and a reduction of acute and chronic side effects during prolonged treatment. ONls, 19 and 21 are chimeric oligonucleotides with uniform phosphorothicate backbones, and substituted with methoxy at the 2, position of the sugar moiety as indicated above. ON19 is targeted to
                                    1.12

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This sequence represents a primer for the coding sequence for the protein of the invention. The protein of the invention is a recombinant protein (A), that comprises at least one region corresponding to an immunoglobulin (Ig) variable region which enables the protein to recognise and specifically bind to an antigen, preferably human Fas, and has substantially no more immunogenicity in a human patient than a human antibody. The proteins are useful for treating autoimmune diseases, especially rheumatism (rheumatoid arthritis). (A) is based on a murine monoclonal antibody. As the protein lacks the constant region, it has substantially no more immunogenicity in the human patient than a human

                                                                                                                                                                                                                                                                                                                                                                                  Composition for cancer treatment - comprising anionic polysaccharide, and oligo:nucleotide targetted to mRNA encoding human c-raf and dextran
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      A pharmaceutical composition has been developed comprising an oligonucleotide, targeted to human raf encoding mRNA, and an anionic polysaccharide. The present sequence represents a specifically claimed oligonucleotide for use in the composition. The composition can be used to treat mammalian cancer, especially human lung, stomach, renal, breast, laryngeal, pancreatic or colorectal cancer, or malignant melanoma. The anionic polysaccharide increases tumour uptake of the oligonucleotide, particularly an oligonucleotide targeted to human raf encoding mRNA
              /note= "Phosphorothioate backbone; optionally being substituted at the 2'-position of the sugar moiety by a methoxy group at positions 1 to 12"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Prostate, disease, PS112 gene, detection, diagnosis, cancer, treatment, antibody, primer, ss.

                                                                                                                                                                AAV26668-V26669 are RT-PCR primers used in the isolation of the PS112 gene which is used in a novel method of detecting the presence of a target PS112 polynucleotide in a test sample. The method can also be used to detect mRNA of PS112 in a test sample. The method can be used for diagnosis of prostate cancer, as the presence of PS112 is an indicator of prostate cancer. Antibodies against the polypeptides may be used as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New Bacillus stearothermophilus DNA polymerase I clones - with reduced 3'-to-5' exonuclease activity useful for automated DNA sequencing and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          PCR primers AAV67205-10 are used to create 5' truncated Bacillus stearothermophilus DNA polymerase I enzymes. The truncated enzymes have DNA synthesis activity but are deficient in 3'-to-5' exonuclease activity. The new DNA polymerases are useful for nucleic acid synthesis by primer extension reactions, including manual, cycle (especially automated) DNA sequencing or labelling. (Updated on 25-MAR-2003 to correct PR field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            3' PCR primer P5 used to create a 5' truncated DNA polymerase I enzyme.
Detecting a target PS112 polynucleotide - used for diagnosing prostate

                                                                                                                                                                                                                                                                                                                                                                                                                                                ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            invention. Oligonucleotides of the invention are nuclease resistant, and comprise covalently-bound nucleosides that individually include a ribose or decoxribose sugar portion and base portion where the nucleosides are joined together by internucleoside linkages such that the base portion of the nucleosides form a mixed base sequence that is complementary to a RNA base sequence. At least one of the nucleosides has a modified ribofuranceyl moiety bearing a 2'-aminoalkcxy or 2'-imidazolylalkoxy substituent. The nuclease resistant compounds can be used for modulating the activity of DNA or RNA. They can be used for treating organisms having a disease characterised by the undesired production of a protein. Diverse organisms such as bacteria, yeast, production of a protein. Diverse organisms such as bacteria, yeast, protectod a protein. Diverse organisms such as bacteria, yeast, protectod a protein. The mount of the moint and higher animal forms including warm-blooded can mimals can be treated in this manner. The compounds can be used in treating e.g. AIDS, atherosclerosis or they can also be used in diagnostic methods for detecting the presence or absence of abnormal RNA
                                                                                            ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                New 2'-0-modified oligo-nucleotide(s) - comprising nucleotide(s) comprising a 2'-aminoalkoxy or 2'-imidazolylalkoxy substituent, used for hybridisation to RNA or DNA.

The present invention describes a method for measuring the resistance of p53 mutant cancer cells to the cytotoxic effects of chemotherapeutic agents by testing a sample comprising p53 mutant cells or an extract from p53 mutant cells for the abundance of cyclin protein D1. AAX90360 to AAX90373 represent reverse transcription PCR primers used to amplify the human p53 gene. The method can be used to predict the response of human cancer cells to anticancer therapy agents which can be used to select the most appropriate therapy for patients suffering from cancer. High cyclin D1 levels or high cyclin D1 expression together with p53 mutation is p1 levels or high cyclin D1 expression together with p53 mutation is strongly associated with resistance to cis-daminedichoroplatinum (CDDP) in human cancer cells. The test may be used to detect radiation may be a vibale alternative to CDDP or if other cycloxic agents would be more suitable, e.g. may suggest that Taxol should be considered as an alternative therapy as it may not be sensitive to a combination of p53 mutation and cyclin D1 protein overexpression
                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
molecules, or abnormal or inappropriate expression of normal RNA molecules in organisms or cells. (Updated on 20-MAR-2003 to correct PR field.)

The invention provides a new method for identifying and characterising cells. The method for determining the genetic proximity of a first cell and a second cell comprises: (a) obtaining the first cell and the second cell the pattern cell; (b) determining in the first cell and the second cell the pattern of expression of genes in a selected gene family; and (c) calculating a pecifical formula. The methods can be used for characterising cells, e.g. for determining the origin of a cell, its genetic status, whether it carries a genetic defect, or whether it is characterising cells, a fetus. They can also be used for determining the an individual e.g. a fetus. They can also be used for determining the effect of a selected treatment on a test cell. They can also be used for determining the ceffect of a selected treatment on a test cell. They can also be used for property. The method uses reverse transcriptase polymerase chain reaction (RT-PCR) for determining the pattern of gene expression in a selected gene family. Sequences AAZ17803-218342 represent primers that can be used in the RT-PCR reactions to determine set of homeobox genes, kinase genes, protein phosphatase genes, P450 enzyme genes, steroid receptor

The invention provides a new method for identifying and characterising cells. The method for determining the genetic proximity of a first cell and a discond cells. The method for determining the genetic proximity of a first cell and a second cell comprises: (a) obtaining the first cell and the second cell the pattern of expression of genes in a selected gene family; and (c) calculating a proximity index using a specified formula. The methods can be used for characterising cells, e.g. for determining the origin of a cell, its genetic status, whether it carries a genetic defect, or whether it is transformed. They can be used for detecting a selected genetic defect in an individual, e.g. a fetus. They can also be used for determining the effect of a selected treatment on a test cell. They can also be used for obtaining cells capable of expressing an homeobox related desired containing the pattern of gene expression in a selected gene family. Sequences Aal71003-Z13042 represent primers that can be used to the RT-PCR reactions to determine the pattern of gene expression. The method uses a contained the pattern of gene expression. The containing the pattern of gene expression. The containing the pattern of gene expression. The containing the contains the pattern of gene expression. The containing the pattern of gene expression. The containing the pattern of pattern of gene expression. The containing the pattern of pattern of gene expression. The containing the pattern of pattern of gene expression. The containing the pattern of pattern of gene expression. The containing the pattern of pattern of gene expression. The containing the pattern of pattern of gene expression. The containing the pattern of pattern of gene expression. The containing the pattern of pattern of pattern of genes with the containing the pattern of pattern of pattern of genes and pattern of patter

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     /note= "contains phosphorothioate linkages; optional 2' -methyl modification on some base pairs"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Oligonucleotides targeted to human raf mRNA useful for treating and diagnosing abnormal proliferative states and inhibiting raf expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention provides antisense oligonucleotides targeted to mRNA encoding human raf and capable of inhibiting raf expression. The antisense oligonucleotides are useful for treating and diagnosing abnormal proliferative states and hyperproliferation (e.g. cancer, psoriasis, or blood vessel restenosis), and inhibiting raf expression. Sequences AAZI1511-537 and AAZI1555-573 represent antisense
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Score 14.8; DB 1; Length 20;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention provides a new method for identifying and characterising cells. The method for determining the genetic proximity of a first cell and a second cell comprises: (a) obtaining the first cell and the second cell; (b) determining in the first cell and the second cell; (c) determining in the first cell and the second cell; (d) determining in a selected gene family; and (c) calculating of proximity index using a specified formula. The methods can be used for characterising cells, e.g. for determining the origin of a cell, its genetic status, whether it carries a genetic defect, or whether it is transformed. They can be used for determining the crising cells capable of expressing an lomeobox related determining the effect of a selected treatment on a test cell. They can also be used for obtaining cells capable of expressing an homeobox related desired property. The method uses reverse transcriptase polymerase chain reaction (RT-PCR) for determining the pattern of gene expression in a selected gene family. Sequences AA217803-218342 represent primers that can be used in the RT-PCR reactions to determine the pattern of gene expression. The gene family can be selected from a set of homeobox genes, kinase genes, protein phosphatase genes, because a set of portein receptor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

The present invention describes a method for the diagnosis of a cancerous or pre-cancerous state from the co-elevation of cyclin-dependent kinase 1 (CDK1) and CDK4 levels. The method may be used for the clinical diagnosis of cancerous or pre-cancerous cells. In addition the combination of targets may be used to screen for drugs that may specifically act on cancer cells. The combination of CDK1, CDK4 elevation and p53 mutation in combination form a complex target that is likely to be specific for cancerous cells. AAX90388 to AAX90401 represent reverse transcription PCR primer for the human p543 gene, used in an example from the present
                                                                                                                                                                                                                                                                                         Diagnosis of cancerous or pre-cancerous cells by monitoring the levels of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a nuclease resistant compound that hybridises with RNA or DNA. The compound comprises covalently-bound nucleosides that individually include a ribose or deoxyribose sugar portion and a base portion, where the nucleosides to the nucleoside form a mixed base sequence that is complementary to a RNA base sequence or to a DNA base sequence that is complementary to a RNA base sequence or to a DNA base sequence; and where at least 1 of the nucleosides includes a modified deoxyfuranosyl moiety bearing a 2'-substituent selected from cyano, fluoromethyl, thioalkoxyl, alkylsulphinyl, alkylsulphonyl, alkylsulphonyl, alkylsulphonyl, alkylsulphonyl, alkylsulphonyl, alkylsulphonyl, alkylsulphonyl, alkylsulphonyl, alkylsulphonyl, alkylsulphonyl alkeneoxy groups. The nuclease resistant oligonucleotides (ONs) can bind to organisms having a disease characterised by the undesired production of a protein. They can be used in therapeutic or prophylactic treatment in organisms such as bacteria, yeast, protozoa, algae, plant and higher animal forms including warm-blooded animals. The ONs can also be used for treating infections, AlbS, atherosclerosis or tumours. The products can be used for detection and diagnosis. The ONs provide enhanced binding to targets. Increased binding of 2'-sugar modified sequence-specific ONs provides superior potency and specificity compared to phosphorus-modified ONs. The present sequence represents a chimeric antisense oligo for craf

```
sensitivity of cancer cells to anti-cancer agents by measuring the mutational status, expression and /or function of signal transduction factors. The method, by measuring the resistance of cells to anti-cancer agents, is useful for selecting the most appropriate therapy for patients suffering from cancer. AAX90374 to AAX90387 represent reverse transcription PCR primer for the human p543 gene, used in an example from the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   A method has been developed for the detection of one or more single polymorphisms in the same sample. The method comprises: (a) hybridising at least one distinguishable interrogation oligomorelectide primer (IP) to one or more target nucleic acids (TNA), each IP being specific for a unique region in TNA with the 3'-end of IP immediately adjacent to a specific and unique target nucleotide (nt); (b) extending IP with a template-dependent polymerase in presence of at least one non-extendible nt (or analogue); and (c) determining, for each IP, the identity of the non-extendible nt or analogue incorporated, i.e. the complement of the target nt, so identifying each target nt. The method is used to identify a trait (specifically a genetic disease or condition) in nucleic acid from an animal, plant, bacterium, fungus, yeast, virus, viroid or other
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Detecting single nucleotide polymorphisms - by hybridisation with interrogation primer and extending this with non-extendible nucleotide analogue which is then identified.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Polymorphic site; equine allele; detection; identification; identity; ancestry; genetic disease; cancer; asthma; blindness; haemophilia; sickle-cell anaemia; ss.

polymorphisms in the same sample. The method comprises: (a) hybridising at least one distinguishable interrogation oligonucleotide primer (IP) to one or more target nucleic acids (TNA), each IP being specific for a unique region in TNA with the 3'-end of IP immediately adjacent to a specific and unique target nucleotide (nt); (b) extending IP with a template-dependent polymerase in presence of at least one non-extendible to an analogue); and (c) determining, for each IP, the identity of the non-extendible in to analogue incorporated, i.e. the complement of the non-extendible of a reaget int, so identifying each target nt. The method is used to identify a trait (specifically a genetic disease or condition) in nucleic acid from an animal, plant, bacterium, fungus, yeast, virus, viroid or other heritable agent. Applications include determining identity (genetic fingerprinting); ancestry; predisposition to genetic diseases or conditions (e.g. cancer, asthma, blindness); presence or absence of desirable trait; diagnosis of disease (e.g. haemophilia or sickle-cell anaemia) and to relate polymorphisms to particular traits. Axx03995 to AXX04067 represent the invariant 5'-proximal and 3'-distal sequences of
                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Detecting single nucleotide polymorphisms - by hybridisation with interrogation primer and extending this with non-extendible nucleotide or analogue which is then identified.
          fingerprinting); ancestry; predisposition to genetic diseases or conditions (e.g. cancer, asthma, blindness); presence or absence of desirable trait; diagnosis of disease (e.g. haemophilia or sickle-cell anaemia) and to relate polymorphisms to particular traits. AAX03996 to AAX04067 represent the invariant 5'-proximal and 3'-distal sequences of polymorphic sites of corresponding equine alleles
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Polymorphic site; equine allele; detection; identification; identity; ancestry; genetic disease; cancer; asthma; blindness; haemophilia; sickle-cell anaemia; ss.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ઠ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                onlymorphisms in the same sample. The method comprises: (a) hybridising at least one distinguishable interrogation oligonucleotide primer (IP) to one or more target unclaic acide (TMA), each IP being specific for a unique region in TNA with the 3'-end of IP immediately adjacent to a specific and unique target nucleotide (Nt); (b) extending IP with a specific and unique target nucleotide (Nt); (b) extending IP with a specific and unique target nucleotide (Nt); (b) extending IP with a to template-dependent polymerase in presence of at least one non-extendible nt or analogue incorporated, i.e. the complement of the non-extendible nt or analogue incorporated, i.e. the complement of the target nt, so identifying each target nt. The method is used to identify come an animal, plant, bacterium, fungue, yeast, virus, viroid or other heritable agent. Applications include determining identity (genetic fingerprinting); ancestry, predisposition to genetic diseases or conditions (e.g. cancer, asthma, blindness); presence or absence of conditions (e.g. asthma, blindness); presence or absence of an acidle or an animal; plant, bacterium, conditions (e.g. asthma, blindness); presence or absence of absence of absence of conditions (e.g. acid or disease (e.g. absence or absence of acid or analogue).
                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Detecting single nucleotide polymorphisms - by hybridisation with interrogation primer and extending this with non-extendible nucleotide or analogue which is then identified.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          anaemia) and to relate polymorphisms to particular traits, AAXON996 to AAXO4067 represent the invariant 5'-proximal and 3'-distal sequences of polymorphic sites of corresponding equine alleles

An method has been developed for the detection of one or more single
polymorphisms in the same sample. The method comprises: (a) hybridising
at least one distinguishable interrogation oligonocleotide primer (IP) to
one or more target nucleic acids (TNA), each IP being specific for a
unique region in TNA with the 3'-end of IP lummediately adjacent to a
cunique region in TNA with the 3'-end of IP lummediately adjacent to a
specific and unique target nucleotide (nt); (b) extending IP with a
cepture of the capendent polymerase in presence of at least one non-extendible
cent (or analogue); and (c) determining, for each IP, the identity of the
non-extendible nt or analogue incorporated, i.e. the complement of the
carget nt, so identifying each target nt. The method is used to identify
ca trait (specifically a genetic disease or condition) in nucleic acid
from an animal, plant, bacterium, fungus, yeast, virus, viroid or other
centric fingerprinting); ancestry; predisposition to genetic diseases or
conditions (e.g. cancer, asthma, blindness); presence or absence of
desirable trait; diagnosis of disease (e.g. haemophilia or sickle-cell
anaemia) and to relate polymorphisms to particular traits. AAX03996 to
AAX04067 represent the invariant 5'-proximal and 3'-distal sequences of
polymorphic sites of corresponding equine alleles
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Detecting single nucleotide polymorphisms - by hybridisation with interrogation primer and extending this with non-extendible nucleotide or analogue which is then identified.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Equine allele polymorphic site of clone 595-1 5'-proximal sequence #1.

The specification describes methods for detection of DNA and RNA basepair mismatch cleavage products, which indicates the presence and sequence of target DNA and RNA. Detection of the target is enhanced by amplification through recycling targets by maintaining an assay temperature between the melting point of the target/probe duplex and that of the target/probe duplex and that of the target/product complex, in the presence of an amplifier. The methods are used to detect and quantify specific DNA and RNA targets, e.g. in genetic diseases or infectious agents. They can also be used to detect mutations. The methods of the invention recycle the targets to dramatically increase the sensitivity of the mismatch repair assay, and allows for detection of a million or fewer target DNA on RNA molecules.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          PCR primers AAZ01426-Z06209 were used to amplify open reading frames (ORFs) of the genome of Chlamydia trachomatis (see AAZ01425). These ORFs encode polypeptides (see AAX36734-Y37949) which can be used as vaccines against Chlamydia trachomatis. Antisense and ribozyme sequences can also be used to control growth of the microorganism. Chlamydia trachomatis is responsible for a large number of diseases, e.g. eye diseases such as conventional trachoma, nonendemic trachoma, paratrachoma, and inclusion epidymitis, genital diseases such as nongonococcal uretritis, epidymitis, cervicitis, salpingfitis, perihapatitis, barkholinitis, peneumopathy in breast feeding infants; and venereal lymphogranulomatosis. The polypeptides of the invention may be of use in treating these
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                PCR primer for amplification of human breast tumour cell line DNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

and other nucleic acid sequences from the genome of Chlamydia pneumoniae and other nucleic acid sequences from the genome of Chlamydia pneumoniae (see AAX91990). C. pneumoniae causes respiratory disease such as pneumonia and bronchitis and is thought to be a contributing factor in heart disease, sarccidosis, sinusitis, purulent otitis media, erythema nodosum or pharyngitis. The polypeptides encoded by the open reading frames of the C. pneumoniae genome (see AAY34584-AAY35879) can be used in immunogenic compositions as vaccines. Vectors containing C. pneumoniae nucleotides sequences can also be used as immunogenic compositions, especially where the vector directs the expression of a neutralising epitope of C. pneumoniae
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New antisense oligonucleotides that detect and modulate the expression of Jun N-terminal kinase proteins - useful for treating hyperproliferative diseases and inhibiting tumor growth in animals, and for modulating

The oligonucleotides specifically hybridize to a nucleic acid encoding a JNK1, JNK2 or JNK3 protein, and which modulate expression of these proteins. The oligonucleotides are useful for modulating JNK protein. The oligonucleotides are also useful for modulating JNK protein of a protein that has been phosphorylated by a JNK protein, and the expression of a cellular protein that protein that passen also form pharmaceutical composition events. The oligonucleotides also form pharmaceutical compositions for treating animals with a hyperproliferative disease, and for inhibiting

                                                                                                                                                                                                                                                     The present sequence represents a phosphorothioate antisense oligonuclectide used to inhibit c-raf gene expression. The oligonuclectide is a gapped 2' modified oligonuclectide, whereby one part has at least two consecutive 2'-F (2'-H) nuclectides and the second part has at least five consecutive nuclectides with 2'-H sugar moieties. The modified oligonuclectide has increased nuclease resistance, and increased binding affinity for substrates. The oligonuclectide elicits RNase H strand cleavage of specific RNAs, Oligonuclectides of the invention are useful for the diagnosis, detection and treatment of conditions susceptible to oligonuclectide therapeutics (e.g. AIDS and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to antisense oligonucleotides that detect and modulate the expression of Jun N-terminal kinase (JNK) proteins. The oligonucleotides specifically hybridize to a nucleic acid encoding a JNK1, JNK2 or JNK3 protein, and which modulate expression of these proteins. The oligonucleotides are useful for modulating JNK protein expression and cell cycle progression in cultured cells or animal cells. The oligonucleotides are also useful for modulating the phosphorylation
                                                                                                                                                                                                                                                                          Antisense oligonucleotide; Jun N-terminal kinase; JNK; hybridise; JNKl; JNK2; JNK2; Gell cycle progression; phosphorylation; tumour; probe; hyperproliferative disease; human; ss.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New antisense oligonucleotides that detect and modulate the expression o
Jun N-terminal kinase proteins - useful for treating hyperproliferative
diseases and inhibiting tumor growth in animals, and for modulating
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        of a protein that has been phosphorylated by a JNK protein, and the expression of a cellular protein that promotes one or more metastatic events. The oligonuclectides also form pharmaceutical compositions for

The present invention describes a method (M1) for diagnosing Alzheimer's disease (AD) comprising determining the level and/or activity of a transcription and/or translation product of a cystatin C gene (N1) or a polymorphic variant (N1a) of N1. Also described are: (1) a method (M2) for diagnosing AD comprising determining the presence or absence of a polymorphism in a cystatin gene; (2) a kit for carrying out M1 or M2; (3) a method (M3) for treating or preventing AD comprising administering an agent (I) which affects the level and/or activity of N1 or N1a, or the transcription and/or translation products of N1 or N1a; (4) the agent (I) in (3); (5) a method (M4) for identifying (I) comprising: (4) the agent (I) and a transcription product of N1 or N1a; (b) contacting the sample with (I); and (c) comparing the activity and/or level of the substances with (I); and (c) comparing the activity and/or level of the substances defere and after step (b). The methods are useful for prevention, changons and treatment of AD. The present sequence represents a PCR primer for the human cystatin C gene, which is used in an example from
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Diagnosing Alzheimer's disease comprising determining the level and/or activity of a transcription and/or translation product of a cystatin C gene or its polymorphic variant.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps

```
A novel method for modulating cell adhesion molecule expression involves antisense inhibition of a tumour necrosis factor (TNF) alpha signalling molecules. In the method TNF alpha signalling molecules Ha-ras, c-raf and c-dun N-terminal kinase (JNK) 2 were inhibited by antisense oligonucleotides. In addition an antisense oligonucleotide to the cell adhesion molecule E-selectin was also examined. The present sequence is the JNK2 antisense oligonucleotide. The antisense oligonucleotides used in the method contained modifications, namely phosphorothioate linkages and 2 methoxyethoxy bases. Some C residues also had a 5 methyl modification. Inhibitors of the TNF alpha signalling molecules have antibacterial, immunosuppressive, antipactic, antidiabetic, antithiranmatory activity. The antisense inhibitors may be useful for the tracement of sepsis, rheumatoid arthritis, inflammatory, immune disease, inflammatory bowel disease, allergic contact dermatitis, psoriasis,

pCR primers AAA64094-95 were used to amplify a cDNA fragment of a human prostate cancer associated gene, which is designated PS112. PS112 sequences are useful for detecting, diagnosing, staging, monitoring, prognosticating, preventing, treating, or determining the predisposition of an individual to disease and conditions of the prostate, such as prostate cancer, tumours and metastases
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Novel methods for diagnosing prostate cancer by contacting test sample with target specific polynucleotide and detecting prostate cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gapa

                                                                                                                                                                                                                                                                         AAZ65654 to AAZ69578 represent human biallelic markers from the present nursention, which contain a polymorphic base at position 24 of their nucleotide sequences. AAZ69579 to AAZ7440 represent amplification primers for the biallelic markers. The biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents and dispossic methods, as well as the characterisation of the pharmaceutical agents acting on a disease as well as other treatment.                                                                                                                                                                                                                                                                                                                                                                                       The present invention describes a method which comprises making a high-density gene chip, specifically for making high-density micro-array of oligonucleotide probes. An oligonucleotide probes selecting process to seek preferentially length variable and coverage variable probes is provided to ensure identical cross melting temperature of probes to the maximum limit, and this can make the cross control of gene chip relatively simple and raise the reliability of the gene chip detecting relatively simple and raise the reliability of the gene chip detecting detecting target sequence directly, detecting mutation in both specific and non-specific sites and a probe overall arrangement scheme. AAA79738 to AAA80201 represent oligonucleotide probe sequences which are used in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Polyribonucleotide solid phase synthesis; diagnosis; hybridisation; protein production modulation; 2'-deoxyfuranosyl moiety; anti-HIV; antiarteriosclerotic; nuclease resistant; atherosclerosis; AIDS; abnormal cell proliferation; tumour formation; ss.

The present invention describes nuclease resistant oligonucleotides (I) comprising 2'-fluoro modified ribofuranosyl nucleotides. (I) comprise covalently bound nucleotides where the nucleotides in comparise by: (a) internucleotide linkages such that the base portion of the nucleotides forms a mixed base sequence; and (b) at least one of the nucleotides forms a modified ribofuranosyl group bearing a 2'-fluoro substituent; provided that at least two of the nucleotides are 2'-fluoro substituent; provided that at least two of the nucleotides are 2'-fluoro substituent; provided that at least two of the nucleotides are 2'-fluoro constituent; provided that at least two of the nucleotides are 2'-fluoro substituent; provided that to taste target RNA, and inhibit its expression. (I) are resistant to nuclease degradation and hybridise with appropriate strength and fidelity to its target RNA/DNA. (I) are also useful as research agents diagnostic agents and as oligonucleotide thereaged in conjunction with AZT to treat AIDS patients. (I) have been cat used to omodulate the expression of the treated arteries whose activate form has been implicated in abnormal cell proliferation and tumour formation. (I) are also used to modulate the expression of protein phosphorous modified oligonucleotide duplexes containing methylphosphonates, phosphoramidates and phosphate triesters. The present an oligonucleotide used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Forward PCR primer for detection of microsatellite marker TNFRSF1B intron 4 polymorphic region.
Nuclease resistant oligonucleotides useful as research agents, diagnostic agents, and in the treatment of atherosclerosis and AIDS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Tumour necrosis factor; TNF; TNF-R2; TNFRSF1B; PCR primer; tumour necrosis factor receptor superfamily member 1B; human; cardiovascular disease; coronary artery disease; non-insulin dependent diabetes mellitus; neuropathy in NIDDM; essential hypertension; hyperlipidemia; diabetic neuropathy; vasoprotective; antihypertensive; lipid-lowering; chromosome 1p36.2; p1S2814; ss.

A novel method for determining a predisposition in a subject to a complex polygenic disease involves assaying chromosome 1 for a genetic marker indicative of a predisposition to the disease. This method may be used for determining predisposition to cardiovascular disease, coronary artery disease, non-insulin dependent diabetes mellitus, neuropathy in NIDDM, essential hypertension, hyperlipidemia and diabetic neuropathy. The method can be used for testing an individual with a family history or in the early stages of a complex polygenic disease to ascertain the chance of developing hypertension, neuropathy or lipid disturbances such as high total cholesterol, high low density lipoprotein cholesterol, abnormal apolygenic disease to ascertain the chance coplygenic disease disposition has been identified the subject can be treated to prevent or reduce the disease or delay its onset. The genetic marker used in the method is DIS2834 and includes a CA repeat region in intron 4 of the tumour necrosis factor receptor superfamily member 1B (TNPRSTB) gene. The marker is located at chromosome 1936.2. The present sequence is the forward PCR primer used for detection of the

consists of a light and heavy chain polypeptide produced synthetically. The agents of the invention exhibit antirheumatic and immunosuppressive activity and can be used to treat autoimmune diseases, especially rheumatism. The IgM molecule used in the invention has human Fas-antigen binding properties. Included in the invention are nucleotide sequences of the invention are nucleotide sequences of corresponding protein sequences (see AAB12913-1812918 and AAB12919), and corresponding protein sequences (see AAB12913-1812918 and AAB12919), and nucleotide sequences of the humanised anti-human Fas Ig CH11 (see AAB12902-AAB206) and protein sequences (see AAB12908-B12910). Also included are anti-human Fas antibody CDP peptides (AAB12902-B12907). Primers specific for the anti-human Fas antibody, light, heavy and kappa chains used in the invention are represented by sequences AAA78213-A7826. Primers used for sequences AAA78213-A78318 and AAA78335-A78313, while humanised anti-Fas Ig DNA sequencing primers are sequences AAA78212-A78313 and AAA78331-A78312-A78331 and AAA78331-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A78313-A

Novel antisense compound 8-30 nucleobases in length targeted to human fra -1 and which specifically hybridizes with and inhibits the expression of human fra-1, useful for modulating the expression of fra-1 in cells. The present sequence is one of a large number of antisense oligonucleotides which are targeted to nucleic acids encoding fra-1. The sequences may be oligodeoxyribonucleotides or chimeric oligonucleotides containing a central gap region consisting of ten 2'-deoxynucleotides, which is flanked on both sides by 2'-methoxyethyl (2'-MOE) wings. The oligonucleotides have a phosphorothioate backbone and the cytidine Claim 3; Col 42; 38pp; English.

The present sequence is one such antisense oligonucleotide. The oligonucleotides of the present invention are useful for treating diseases or conditions with reduced apoptosis, e.g. cancer and cellular hyperproliferation. The oligonucleotides may also be used to increase the stimulation of apoptotic proteins, e.g. for treating Alzheimer's or Parkinson's disease, amylotrophic lateral sclerosis, retinitis, pigmentosa, epilepsy, myocardial infarction, stroke, obstructive jaundice, polycystic kidney and diabetes. The present sequence may have a phosphorothioate backbone
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Novel methods for reducing apoptosis comprising contacting cells with antisense oligonucleotides, useful for treating apoptotic disorders, e.g.
residues in the 2'-MOE wings are 5-methylcytidines. The fra-1 antisense oligonucleotides are useful for inhibiting the expression of fra-1 in human cells or tissues. They can be used for diagnostics, therapeutics, prophylaxis and as research reagents and in kits. Use of the antisense compounds may also be useful prophylactically, e.g. to prevent or delay
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Antisense; gene therapy; JNK2 protein; apoptosis; cancer; cellular hyperproliferation; Alzheimer's; Parkinson's disease; amylotrophic lateral sclerosis; retinitis; pigmentosa; epilepsy; myocardial infarction; stroke; obstructive jaundice; polycystic kidney;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to antisense oligonucleotides (AAC62844-C63000, AAA6099-A96099 and AAA07993) that hybridise specifically to a nucleotide encoding a Jun N-terminal kinase (JNK2) protein, resulting in decrease of JNK2 expression and leading to induction of apoptosis. The present sequence is one such antisense oligonucleotide. The oligonucleotides of the present invention are useful for treating diseases or conditions with reduced apoptosis, e.g. cancer and cellular hyperproliferation. The oligonucleotides may also be used to increase the stimulation of apoptotic proteins, e.g. for treating Alzheimer's or Parkinson's disease, amylotrophic lateral sclerosis, retinitis, pigmentosa, epilepsy, mycoardial infarction, stroke, obstructive jaundice, polycystic kidney and diabetes. The present sequence may have a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel methods for reducing apoptosis comprising contacting cells with antisense oligonucleotides, useful for treating apoptotic disorders, e.g.

c-raf is a serine-threonine-specific protein kinase and is thought to play a fundamental role in signal transduction, and cell proliferation control. The present sequence is an antisense oligonucleotide. This sequence is targeted to human c-raf gene, resulting in c-raf expression inhibition. The present sequence may be useful for treating and raf-ssociated cell hyperpoliferation conditions such as cancer, hyperplasias, pulmonary fibrosis, angiogenesis, psoriasis, atherosclerosis and smooth muscle cell proliferation in blood vessels egg stenosis or restenosis following angioplasty. Also, the present sequence may be useful for treating inflammatory disorders such as tissue graft rejection, endotoxin shock and glomerular nephritis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö

RESULT 1610 AAA73514/c Human bcl-6 phosphorothioate antisense oligonucleotide, SEQ ID NO:76.

(first entry)

23-FEB-2001

transcriptional repressor; germinal centre formation;

Human; bcl-6; Th-2 mediated

Homo sapiens

31-OCT-2000,

US6140125-A.

Th-2 mediated antibody affinity maturation; apoptosis regulator; chromosome 3027; Immboma; acute lymphoblastic leukaemia; post-transplant lymphoproliferative disorder; expression inhibition; phosphorothioate; antisense oligonucleotide; ss.

```
AASO6832-AASO6897 represent part of a polynucleotide sequence encoding for novel human protein kinases where a single nucleotide polymorphism (SNP) has been identified. The SNP occurs at the last position of the present sequence. The sequences are described relating to the invention of the protein kinase for the sequences are described relating to the invention of protein kinase for a members of the tyrosine or concing protein kinase (PTK and STK) families. The polynucleotides expression. STK families. The polynucleotides on concing protein kinase and the polypeptides may be used in the inappropriate kinase expression. For example, they may be used to treat cancers (especially cancers of haematopoidetic origin), cardiovascular cancers (especially cancers of haematopoid arthritis), neurological disease (e.g. atherosclerosis), metabolic disorders (e.g. diabetes), immune related diseases (e.g. rheumatoid arthritis), neurological disease (e.g. schizophrenia), neurodegenerative disorders (e.g. diabetes), for parkinson's disease (e.g. HIV) and reproductive disorders (e.g. infertility). Additionally, polynucleotides encoding protein kinases may be used for gainst the protein kinases and in assays to identify modulators of
                                                                                                                                   Human; protein kinase; PTK; STK; cancer; cardiovascular disease; SNP; metabolic disorder; immune related disease; neurological disorder; neurodegenerative disorder; inflammatory disorder; infectious disease; reproductive disorder; gene therapy; single nucleotide polymorphism; ds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Nucleic acids encoding human kinase polypeptides, useful for preventing diagnosing and/or treating e.g. cancer, immune, cardiovascular and neuronal-associated diseases, and microbial infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sudarsanam S, Martinez R;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence 20 BP; 2 A; 6 C; 7 G; 4 T; 0 U; 1 Other;
                                                                                               SNP containing protein kinase DNA sequence #17.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              protein kinase expression and activity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Example 8B; Page 330; 433pp; English.

```
Sequences AAC81144-C81223 represent antisense oligonucleotides targetted to the human bcl 6 gene, which inhibit its expression. The antisense oligonucleotides were designed to target different regions of the human bcl-6 mRNA, and were analysed for their effect on bcl-6 mRNA levels by quantitative real-time PCR. Bcl-6 (also known as B-cell CLL/ lymphoma 6, and finger protein 51 and LAZ3) is a sequence-specific DNA-binding transcriptional repressor. The bcl-6 gene is expressed in germinal centre B- and T- cells and is required for germinal centre formation and Th-2 mediated antibody affinity maturation. Bcl-6 may also play a role in the region which undergoes a high frequency of translocation events. Such crossomal translocations can result in abbrarant forms of Bcl-6, which are strongly implicated in the pathogenesis of several types of lymphoma, and have also been reported in acute lymphoblastic leukaemia and post-transplant lymphoplastic disponders. The algonomicleotides of the conditions associated with aberrant forms of bcl-6, such as lymphomas, also expended with aberrant forms of bcl-6, such as lymphomas, also expended by a post-transplant lymphoblastic leukaemia and post-transplant lymphoblastic leukaemia and post-transplant lymphoblastic leukaemia and post-transplant lymphoplastic leukaemia and post-transplant lymphoplastic leukaemia and post-transplant lymphoplastic leukaemia and post-disposis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human daxx inhibitory antisense phosphorothioate oligonucleotide SEQ:32.

nucleobases in length, where (I) inhibits expression of daxx (also known as Fas binding protein, CENP-C binding protein, dap6 for death associated protein, and EAP for Ets-1 associated protein). (I) has cytostatic and antiinflammatory activity, and can be used in antisense therapy and as a modulator of daxx. (I) is useful for inhibiting the expression of daxx in therapeutics for the treatment of diseases associated with the expression of daxx, prophylaxis e.g. to prevent or delay infection, inflammation or tumour formation and as research reagent. The present sequence represents an inhibitory human daxx antisense phosphorothioate oligonucleotide which
                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel antisense compounds capable of modulating expression of daxx useful for diagnosis, prophylaxis and treatment of diseases associated with expression of daxx.

Sequences AAF59817-AAF59896 represent phosphorothioate 2'-WOE gapmer antisense targetted to the human protein kinase C-theta gene, which inhibit its expression. The antisense oligomucleotides were designed to target different regions of the human protein kinase C-theta RNA, and were analysed for their effect on protein kinase C-theta RNA, and were analysed for their effect on protein kinase C-theta RNA, levels by quantitative real-time PCR. Protein kinase C-theta (also known as PKC-theta, PKCT, PKKCT, nPKC-theta and PKKCO) is one of several protein kinase C isozymes and is ubiquitously expressed, with the highest levels kinase C isozymes and is ubiquitously expressed, with the highest levels can a calcium-independent fashion, and it is involved in a variety of in a calcium-independent fashion, and it is involved in avariety of the JNK/SAPK (Jun N-terminal Kinase/Atress-activated protein kinase) pathway. Protein kinase C-theta is also involved in T-cell signalling pathways, cell cycle control, cellular activation, API transcription pathways cell cycle control, cellular activation, and angiogenesis on wound repair. It is additionally involved in insulin signalling and is thought to play a role in the development of diabetes in humans. The coligonucleotides of the invention are useful for diabetes in humans. The and treatment of conditions associated with protein kinase C-theta

expression, such as inflammation, cancer, wound healing disorders and

CC Growth factor 23 (FGF-23). Human FGF-23 is useful for treating a patient growth factor 23 (FGF-23). Human FGF-23 is useful for treating a patient suffering from traumatic injury or a condition characterized by dysfunction of or injury to skin cells, a condition characterized by inadequate function of placental cells (e.g. congenital defects, fertility, or abnormal growth), a condition characterized by inadequate function of the thymus (e.g. lewkemia, lymphoma, autoimmune disease, function of the thymus (e.g. lewkemia, lymphoma, autoimmune disease, proliferative disorder of the thymus, or differential nervous system disorder of the thymus, or a condition characterized by central nervous system disorder (e.g. Parkinson's disease or Alzehimer's disease). The human FGF-23 polynucleotide and polypeptide are also useful in the treatment of congenital malformations of the intestinal wounds, ulcers, inflammation, injuries and surgical anastromoses, motility and absorption disorders, or resulting ischemic and stand diseases (e.g. mycocardial ischemial infarction, peripheral vascular disease, renal artery disease, stroke) and musculoskeletal disease characterized by loss of function, inadequate colls, hone cells, hone cells, bone cells, carporting cells (e.g. mycolle or arkhing merching or death of skeletal muscle cells, hone cells, bone cells, carporting cells (e.g. mycordial disease)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

Sequences AAC92560-C92639 represent antieense oligonucleotides targetted to the human nucleolin gene, which inhibit its expression. The antisense oligonucleotides were designed to target different regions of the human nucleolin meNA, and were analysed for their effect on nucleolin meNA.

Coligonucleotides were designed for their effect on nucleolin meNA levels by quantitative real-time PCF. Nucleolin (also known as P92 or C21) is the most abundant nucleolar phosphoprotein in actively growing cells. Nucleolin primarily participates in ribosome blogenesis and transport of ribosomal components, being able to transiently bind to previous some in the nucleolar being able to transiently bind to previous some in the nucleolar via a ribonucleoprotein consensus sequence. Thewever, it has also been shown to be involved in cytokinesis, coll proliferation and growth, transcriptional repression, replication, signal transduction, and chromatin decondensation. Nucleolin is a member of the Ag-NOR (active ribosomal gene located in the nucleolar corganiser region) family of proteins which are markers of active ribosomal genes, and whose expression is associated with the prediction of tumour growth rate. The presence of antibodies against nucleolin are associated with systemic connective tissue diseases such as systemic conception are useful for diagnosis, conversion and treatment of conditions associated with nucleolin are prevention and treatment of conditions associated with nucleolin are prevention and treatment of conditions associated with nucleolin and prevention and treatment of conditions associated with nucleolin and convention and treatment of conditions associated with nucleolin and appropriated with an analysis and solectodermaliated with nucleolin and the presence of the invention are useful for diagnosis, and active associated with nucleolin and and active the presence of antibodicated with nucleolin and active the presence of a nucleolin and appropriation and appropriated with an active formation and presence asso
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Human nucleolin phosphorothioate antisense oligonucleotide, SEQ ID NO:43.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Novel antisense compound targeted to human nucleolin which specifically hybridizes with and inhibits the expression of human nucleolin, useful for modulating the expression of nucleolin in cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              expression, such as tumour formation, immune disorders and inflammation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequences AAC92560-C92639 represent antisense oligonucleotides targetted to the human nucleolin gene, which inhibit its expression. The antisense oligonucleotides were designed to target different regions of the human nucleolin mRNA, and were analysed for their effect on nucleolin mRNA is not were analysed for their effect on nucleolin mRNA levels by quantitative real-time PCR. Nucleolin (also known as P92 or C23) is the most abundant nucleolar phosphoprotein in actively growing cells. Nucleolin primarily participates in ribosome biogenesis and cells. Nucleolin primarily participates in ribosome biogenesis and ribosome in the nucleolar will a ribonucleoprotein consensus sequence. However, it has also been shown to be involved in cytokinesis, nucleogenesis, cell proliferation and growth, transcriptional repression, replication; signal transduction, and chromatin decondensation. Nucleolar or sa member of the Ag-NOR (active ribosomal gene located in the nucleolar corganiser region) family of proteins which are markers of active ribosomal genes, and whose expression is associated with hystemic connective tissue diseases such as systemic lupus erythemactosus (SIE) and selecotated with nucleolin are associated with systemic connective tissue diseases such as systemic disease. The oligonucleotides of the invention are useful for diagnosis, prevention and treatment of conditions associated with nucleolin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                                                                                                                                                        Novel antisense compound targeted to human nucleolin which specifically hybridizes with and inhibits the expression of human nucleolin, useful for modulating the expression of nucleolin in cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  expression, such as tumour formation, immune disorders and inflammation

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Use of Jun Kinase antisense mRNA for treating cancer by administering vector comprising promoter operably linked to DNA sequence that encodes the antisense mRNA to patient diagnosed with cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention relates to the use of Jun Kinase (JNK) antisense oligomoucleotides for treating cancer and for screening compounds that minic or augment the effect of JNK antisense oligomorleotides treatment for cancer. The present sequence is one such JNK antisense
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps
                                                                                                                                                                                                                                                                /note= "This oligonucleotide is a 2'-0-methoxyethy] chimeric antisense oligonucleotide containing five MOED phoshopodiester residues flanking a 2'-deoxymucleotide/phosphorothioate region"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ;

immune response. The present sequence is one such immunostimulatory mucleic acide can be pyrimidine rich uncleic acide can be pyrimidine rich (py-rich) or thymidine (T) rich. The method is used to vaccinate subjects against tumour antigens, viral antigens (e.g. herpesviridae, retroviridae) and/or critomyxoviridae), bacterial antigens (e.g. toxoplasma, haemophilus, campylobacter, clostridium, Escherichia coli and/or staphylococcus), fungal antigens and/or parasitic antigens. The method is slab useful for present sequence can also be used to redirect a minume deficiency. The present sequence can also be used to redirect a Th2 to a Th1 immune response and to activate immune cells. Note: the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                molecules encoding Mycoplasma hyppenumina Mip3 antigen. Mip3 antigen and its fragments are useful in manufacturing a vaccine for treating or preventing a disease or disorder in an animal, especially pig, caused by M. hyppenumoniae infection e.g. enzootic mycoplasma pneumonia. The mhp3-encoded proteins may be used as immunogens to generate antibodies which immunospecifically bind such an immunogen. The antibodies generated against the antigen are useful in diagnostic immunoassays, passive immunotherapy and generation of anti-idiotypic antibodies. Mip3 proteins may also be used in immunoassays, e.g. to detect or measure in a biological sample from a vaccinated or potentially infected test animal the presence of antibodies to the antigen, and thus to monitor the immune response and/or to diagnose infection of the animal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The sequence is an oligonucleotide primer used to sequence nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New apoprotein antigens encoded by mhp3 gene from Mycoplasma hyopneumoniae useful as a vaccine for treating or preventing diseases caused by Mycoplasma hyopneumoniae.
to a non-rodent subject in sufficient quantity to stimulate an

                                                                                                                            Novel beta fructofuranosidase gene useful for producing beta fructofuranosidase and for developing variant enzymes that have increased heat resistance and transfer ratio by means of genetic engineering
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Vaccine, cytostatic, virucidal, bactericidal, fungicidal, anti-parasitic, immunostimulatory, tumour; viral infection; bacterial infection; fungal infection; parasitic infection, cancer, asthms, infectious disease; allergy, immune deficiency; phosphorothioate; ss.
                                                                                                                                                                                                                                                                 The present invention relates a beta-fructofuranosidase gene. The invetion is useful for the development of variant enzymes that have increased heat resistance and transfer ratio by means of genetic engineering techniques. Beta-fructofuranosidase is useful in the synthesis of transfructosylated oligosaccharides such as lactosucrose, for use in fields of foods and drugs
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

The present invention relates to a method for stimulating an immune response. The method comprises administering an immunostimulatory nucleic

diseases, allergies and asthma nucleic acids.

Vaccinating against tumors, infectious using immunostimulatory Py-rich and TG

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention describes isolated nucleic acids encoding secreted polypeptides, designated PROX polypeptides (i.e. a PRO polypeptide where X is an integer from 1 to 17). PROX polypeptides have cytostatic, immunomodulatory and reproduction activities, and can be used in gene therapy, and as PROX antagonists and PROX agonists. PROX polypeptides, nucleic acids and antibodies are useful in the manufacture of a medicament for treating a syndrome associated with a PROX-associated disorder, e.g. a cell proliferation and/or differentiation disorder (e.g. pre-clampsia). They are also used for screening for a modulator of activity or of latency or predisposition to a PROX-associated disorder. AAP74432 to AAP74448 encode the specifically claimed human PROX polypeptides PRO1 to PRO17 given in ABB70531 to AAB70547. The present
                                                                  Gaps

The present invention describes a method of diagnosing age-related macular degeneration in a individual, involving comparing the level of eystatin C activity compared to a known reference value of a diseased or healthy individual. This is useful in identifying those at risk of and suffering from age-related macular degeneration. The cystatin C gene is found at human formomome 20pl.1.2 and the B allele has been shown to be indicative of an increased risk of the disease. The present sequence is PCR primer used to amplify the cystatin C gene (also known as CST3)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           involves comparing activity and/or level of transcriptional or translational product of Cystatin C gene in patient and control samples.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Diagnosing or prognosing age-related macular degeneration, in a subject

FOR primers AAH75023-24 were used to amplify CDNA encoding human for fibroblast growth factor 23 (FGF-23). The human FGF-23 polymucleotide and colypeptide are useful for treating a patient suffering from traumatic injury or a condition characterized by dysfunction of or injury to skin cells, a condition characterized by inadequate function of placental condition characterized by inadequate function of placental condition characterized by inadequate function of the thymus (e.g. condition characterized by inadequate function of the thymus (e.g. condition characterized by inadequate function of the thymus (e.g. thymus, or differentiation disorder of the thymus), or a condition characterized by central nervous system disorder (e.g. Parkinson's condition characterized by central nervous system disorder (e.g. Parkinson's disease or Alzheimer's disease). The human FGF-23 polymucleotide and polypeptide are also useful in the treatment of Crohn's disease, healing confinemations of the intestine. They are also useful for treating canstomoses, motility and absorption disorders, and congenital consenses, motility and absorption disorders, and congenital consenses, motility and absorption disorders, stroke) and congenital consenses, renal artery disease, stroke) and congenting consenses are an expected or musculoskeletal disease characterized by loss of function, inadequate consenses, renal artery disease, stroke) and consenses of function or death of skeletal muscle cells, bone cells or supporting contracterized by loss of function, inadequate contracterized contract
                                                                                                                                                                factor 23, useful in the treatment of a condition characterized by inadequate function of placental cells (e.g. congenital defects) and the thymus (e.g. leukemia).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Human; systemic lupus erythematosus 1B; SLE-1B; dermatological; ss; antiinflammatory; immunosuppressive; systemic autoimmune disorder; signaling lymphocyte activation molecule; SLM», lymphocyte antigen 9; Ly-9; 2B4; natural killer cell receptor; CD48; CD84; LY108; CS1; DBDD; NIT1; upstream transcription factor 1; USF 1; GOLGA4; immune tolerance;

The present invention relates to a new method for screening for susceptibility to a systemic autoimmune disorder. The method comprises screening for at least one mutation within the systemic lupus erythematosus (SLE)-1B loci. Screening for susceptibility to autoimmune disorders such as systemic lupus erythematosus involves screening for at least one mutation in a gene or genes with the SLE-1B loci such as a gene encoding signalling lymphocyte activation molecule (SLAM), lymphocyte antigen (Ly)-9, 2B4 (a natural killer cell receptor), CD48, CD48, LY108, CSI, DEDD, NITI, upstream transcription factor (USF)1, GOLGA4. The method of the invention is useful for treating SLE and involves administering a mentioned genes. Gene therapy also involves the use of antisense constructs or ribozymes directed against the above mentioned genes for treating SLE. The present nucleic acid sequence represents the human
                                                                                                            Screening for susceptibility to systemic autoimmune disorder by screening for a mutation within the systemic lupus erythematosus-1B loci.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                 reverse PCR primer HMS1-26 that was used in the invention with the human forward PCR primer HMS1-26 (AAS20617) to amplify the human microsatellite marker HMS1-26 (AAS20619) for the S1elB region. HMS1-26 is also known as HMS1-25R and HMS1-4R and is located between the Ly-9 and the 2b4 genes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Screening an unknown base sequence at a defined site of a target single-stranded nucleic acid for use in DNA diagnosis and therapy, comprises a DNA chip, fluorescence yield and pattern-based method.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Nucleic acid base sequence analysis; DNA diagnosis; HSC5; PCR; primer;

                                                  The present invention relates to a method of analysing an unknown nucleic acid base sequence. The method comprises preparing a probe array, hybridising with the probe array, measuring the fluorescence yield in the reaction, obtaining a template pattern, producing a sample pattern, and comparing the sample pattern with the template pattern. The method is useful for specifying an unknown base sequence at a defined site of a target single-stranded nucleic acid, which is useful for analysing a nucleic acid base sequence. The method is applicable in DNA diagnosis and therapy, and is useful in medicine and biology. Measuring the fluorescence yield allows the detection of a one-base mismatch which can be considered to produce high detection accuracy. The hybrid pattern of the DNA probe is used so the difference in themostability is less important, and the judgement on each spot can be reliably carried out. ABK72525-ABK72532 represent PCR primers used in the examples of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Inhibiting angiogenesis in a subject, involves administering at least one antiangiogenic nucleic acid molecule to the subject.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   administering at least one antiangiogenic nucleic acid molecule. Also
included is a kit comprising a first container housing the antiangiogenic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to inhibiting angiogenesis in a subject, comprising
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Angiogenesis inhibitor; 88; angiogenesis; 801id tumour growth; tumour metastasis; precancerous lesion; rheumatoid arthritis; psoriasis; diabetic retinopathy; retinopathy of prematurity; macular degeneration; corneal graft rejection; neovascular glaucoma; retrolental fibroplasia; rubeosis; Osler-Webber Syndrome; myocardial angiogenesis; plaque neovascularisation; telangiectasia; haemophiliac joint; angiofibroma; wound granulation; intestinal adhesion; atherosclerosis;

The present invention relates to a new method of identifying rice individual or seed, for examination, which may contain a fertility eccovery gene (RF-1 gene). The method of the invention involves using the RF-1 gene locus located between the RFLP (restriction fragment length polymorphism) markers loci $12564 and Cl381 existing on the rice 10th chromosome. The method can be used for estimating the genotype of fertility recovery locus to rice piece stimating the genotype of certility recovery gene, which is useful in growing hybrid crice plants. Plural PCR marker loci located around and linked to the Rf-1 gene are developed and the relationship is defined. Therefore, the presence or absence of the Rf-1 gene can be examined, and an Rf-1 gene containtividual is selected conveniently and exactly by calibrating the genotypes of plural PCR marker loci. The present nucleic acid sequence represents PCR primar #1 that was used in the methods of the invention to amplify the G4003 HindIII marker sequence for use in detecting rice Rf-1
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Estimating genotype of fertility recovery locus to rice BT type mal fertility cytoplasm comprises detection of fertility recovery gene, useful in growing hybrid rice plants.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Sequence 20 BP; 6 A; 5 C; 6 G; 3 T; 0 U; 0 Other;

The present invention relates to methods for treating or preventing devoloping administering to a subject having or at risk of developing cancer immunostimulatory nucleic acids that induce expression of cell surface antigens and antibodies. The methods are useful for treating or preventing cancer such as basal cell carcinoma, bladder cancer, bone cancer, brain and central nervous system (CNS) cancer, breast cancer, cervical cancer, colon and rectum cancer, connective tissue cancer, oesophageal cancer, eye cancer, kidney cancer, larynx

Treating or preventing cancer, such as basal cell carcinoma, comprises administering immunostimulatory nucleic acids that induce expression of cell surface antigens and antibodies to a subject having or at risk of

The present invention describes a method of arraying genome clones. The method comprises: (a) clones of the genomic libraries contained in multiwell plates numbered for discrimination are mixed in each of the multiwell plates in the primer designed based on the chromosome marker sequence is added to the mixture to carry out an amplification reaction; (c) a signal corresponding to the marker is detected from the resultant amplified product to specify the discrimination Nos. of the multiwell plates containing the clones having said marker sequence; (d) the order of the markers is changed so that the same discrimination Nos. succeed to the maximum in the specified discrimination Nos. to array the multiwell plates; (e) the clones in the multiwell plates of the specified discrimination Nos. are mixed respectively in each wells of longitudinal and lateral directions; (f) the mixed clones are cultured and the crealtant cultures are amplified by using the above primer; (g) signals are detected from the amplified products; (h) the clones in the multiwell plates are specified from the detected result; and (i) the clones are

The microarray is useful for gene analysis, AB142957 to AB145322 represent PCR primers for human chromosome 1986-35 DNA, and AB145323 to AB145634 represent PCR primers for human chromosome 21q22.1, which are specifically claimed for use in the present invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Appropriate antigens encoded by the M. hyopneumoniae mip3 gene. M. hyopneumoniae is a bacterial pathogen that causes enzootic mycoplasmal pneumonia in pigs. The mip3 genes, proteins and apoprotein antigens of the invention are useful in the manufacture of a vaccine for treating/ preventing a disease or disorder caused by infection with M. hyopneumoniae in an animal, especially a pig. The present DNA sequence represents a PCR primer for the Mycoplasma hyopneumoniae mip3 gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             셤
                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to constructing (M1) a strain of diploid fungal cells in which both alleles of a gene are modified, comprising modifying cone allele by insertion or replacement by a cassette having an expressible selectable marker and modifying other allele by resolution, of a promoter replacement fragment with a heterologous promoter. (M1) is useful for constructing a strain of diploid fungal cells in which both alleles modified are modified. The diploid fungal cells in which both alleles modified are useful for identifying a gene that is essential to the survival or growth of a fungus, a gene that is essential to the survival or growth of a fungus, a gene that contributes to the virulene and/or pathogenicity of a fungus, a gene that contributes to the resistance of a diploid fungus to an antifungal agent, an antifungal agent that inhibits the growth of a diploid fungus or and for identifying a therapeutic agent for treatment of a mammalian disease. (M1) is useful for identifying a compound which modulates the activity of a gene product, preferably enzymatic activity, carbon compound catabolism, blosynthetic, transporter, transcriptional, compound catabolism, blosynthetic, transporter, transcriptional, activity of inhibit growth or proliferation of C. albicans cells and for treating infection by C. albicans. The present sequence is that of a PCR primer used in the method of the invention. Note: The sequence data for this patent is not represented in the printed specification but is based to nequence information supplied to Derwent by the European Patent Office
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ö
                                                                                                                                                                                                                                                                                                                                            Constructing strains for identifying gene products as effective targets for therapeutic intervention, by inactivating in the strain one allele of a gene and placing other allele of the gene under conditional expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Human; raf; hyperproliferation; neovascularisation; ocular angiogenesis; therapy; cancer; cytostatic; anti-angiogenic; vascular; ophthalmological; antisense; phosphorothioate backbone; c-raf kinase; ss.

The invention also relates to methods of inhibiting hyperproliferation of cells which involves contacting the hyperproliferation of cells which involves contacting the hyperproliferation of the invention. The method is useful for treating cancer, angiogenesis or neovascularisation, especially ocular angiogenesis or neovascularisation. The present DNA sequence is an antisense oligonucleotide targetted to human c-raf kinase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Phosphorothioate; HIV-1; azasugar; AIDS; virucide; antiviral; anti-HIV;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Treating cancer, angiogenesis or neovascularization by administering antisense oligonucleotides targeted to human raf sequences.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present sequence is that of a phosphorothioate oligonuclectide of random sequence which includes 4 six-membered azasugar nucleotide derivatives. It is a claimed example of oligonucleotides of the invention (see ABV73816-41) that have been tested as AIDS therapeutic agents. In anti-HIV-1 assays, the oligonucleotide showed higher antiviral activity than AZT, ddC and ddI, and antiviral activity was resistant to the effects of serum. Claimed oligonucleotides of the present invention have low toxicity against cells, are membrane permeable, working outside of cells to inhibit viral attachment of HIV, have a wide antiviral activity against a broad spectrum of HIV variants, are not active against other

```
(I) have melting temperatures within a narrow range. The method is useful for detecting infectious diseases caused by bacterial infectious agents e.g. Salmonella, Listeria monocytogenes and Haemophilus influenza, fungal infectious agents e.g. Cryptococcus neoformans, Candida albicans and functious agents e.g. Cryptococcus neoformans, Candida albicans and Sapergillus fumigautus, viruses e.g. T-cell lymphocytotrophis cirus, pepteinin-Bar virus and polio virus, and parasitic infectious agents selected from Onchovera volvulus, Entamoba histolytica and Dracunculus medinesis. The method is also useful for detecting genetic diseases such as 21 hydroxylase deficiency, Turner Syndrome and Obselty defects.

Detecting cancer involving oncogenes, thuncr suppressor genes, or genes involved in DNA amplification, replication, recombination or repair, the cancer is specifically associated with a gene selected from BRCA1 gene, p53 gene, human papillomavirus types 16 and 18 and liver cancers. The method is also used for environmental monitoring, forensics and the food and feed industry, detecting comprises scanning (using e.g. a scanning electron microscope and infrared microscope) the support at the electron accorded and correlating (using a computer) identified problem and correlating (using a computer) identified brook and correlating (using a computer) identified brook and correlating comprises computers) identified brook and correlating comprises computers) identified brook and correlating computers in computers in the angelon of the oligonucleotide probesed and correlating computers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             presence or absence of the target nucleotide sequences. oligonucleotide probes (II) will hybridise with little mismatch, where oligonucleotide probes (II) will hybridise with little mismatch, where coligonucleotide probes (II) will hybridise with little mismatch, where (I) have melting temperatures within a narrow range. The method is useful for detecting infectious agents e.g. caused by bacterial infectious agents e.g. Salmonella, Listeria monocytogenes and Haemophilus influenza, fungal infectious agents e.g. Cryptococcus neoformans, Candida albicans and Sapergillus funigatuts, viruses e.g. T-cell lymphocytotrophis cirus, Espetein-Barr virus and polio virus, and parasitic infectious agents selected from Onchoverva volvulus, Entamoeba histolytica and Dracunculus medinesis. The method is also useful for detecting genetic diseases such as 21 hydroxylase deficiency, Turner Syndrome and obesity defects. Detecting cancer involving oncogenes, tumour suppressor genes involved in DNA amplification, replication, recombination or repair, the cancer is specifically associated with a gene selected from BRCAI gene, p53 gene, human papillomavirus types I6 and 18 and liver cancers. The method is also used for environmental monitoring, forensics and the food and feed industry, detecting comprises scanning (using e.g. a scanning electron microscope and infrared microscope) the support at the contract and correlating (using a computer) identified brook as a set in a computer of the oligonucleotide probe and infrared microscope) the support at the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    represent oligonucleotide sequences used in the exemplification
